1 Introduction

1.1 Overview

The NFM Ballistic System (NBS) is a system designed for gathering and managing data from laboratory ballistic tests. Historically, the test results were recorded manually in Excel spreadsheets and transferred via pendrives, which presented several challenges, including data inconsistency, lack of centralized access, and potential data loss. Recognizing the need for a more robust solution, it was decided to develop a dedicated system for managing ballistic test data.

1.2 System Components

The system comprises three main components:

- **Construction Creator App:** An application used by ballistic engineers to design ballistic constructions.
- **Test Logging Interface:** A user interface for recording test data and results directly into the system.
- **Power BI Workspace:** A dedicated workspace for analyzing the collected data and creating Power BI dashboards.

1.3 Challenges

The NBS system faces several challenges:

- **Data Inconsistency:** The data stored within the system is messy and lacks uniformity, making it difficult and time-consuming to analyze.
- **Poor Documentation:** The system is not documented, making it challenging for new users to understand its structure. The only available documentation is from 2019 and the system has changed considerably by now.
- **Overall Complexity:** The system's design and architecture are complex and difficult to navigate, which complicates maintenance and further development.

1.4 Project Goals

The primary goals for this project include:

1. **System Exploration:** Thoroughly explore and analyze the NBS system to understand its structure, the tables where data is stored, the solutions utilized and Power BI reports used for data analysis.
2. **Data Quality Analysis:** Perform quality analysis on the available data to assess the data and its usefulness.
3. **Documentation:** Document my findings, providing an overview of the system as it currently stands.
4. **Recommendations:** Provide some recommendations for the nearest future.

2 System Exploration and Findings

This section summarizes the exploration process, focusing on understanding the structure, tables, and solutions used in the NBS system.

2.1 Overview

To fully understand the current state of the system, an exploration of its structure, components, and data was conducted. This section provides an in-depth look at the findings from the exploration, focusing on tables, solutions, and Power BI reports that make up the system.

The exploration began with an analysis of tables within NBS. They were examined to understand their structure, the relationships between them, and the quality of the data they contain. Additionally, the system's solutions were reviewed and listed.

Furthermore, the exploration included a review of the Power BI reports used to visualize the data. Along with tables and solutions, these reports were also comprehensively inventorized.

This section includes a detailed inventory of the tables, solutions, and reports. These findings serve as the foundation for the subsequent analysis, providing a clear picture of the NBS components.

2.2 Tables

The tables used in the NBS system are referred to as "entities." In the Microsoft Dataverse structure, each entity has a logical name (the actual name of the entity) as well as a display name, which is user-friendly and displayed in the application frontend.

While exploring the system, it appeared that tables related to NBS often start with one of the following prefixes: cr675_, cr91b_, or craab_. As the Microsoft Dataverse API returns a list of all tables, these prefixes served as flags when identifying which tables could be related to NBS. This approach narrowed down the search from hundreds of tables to several dozen.

Another indication of which tables were in use was the Data Analyzer Power BI report.

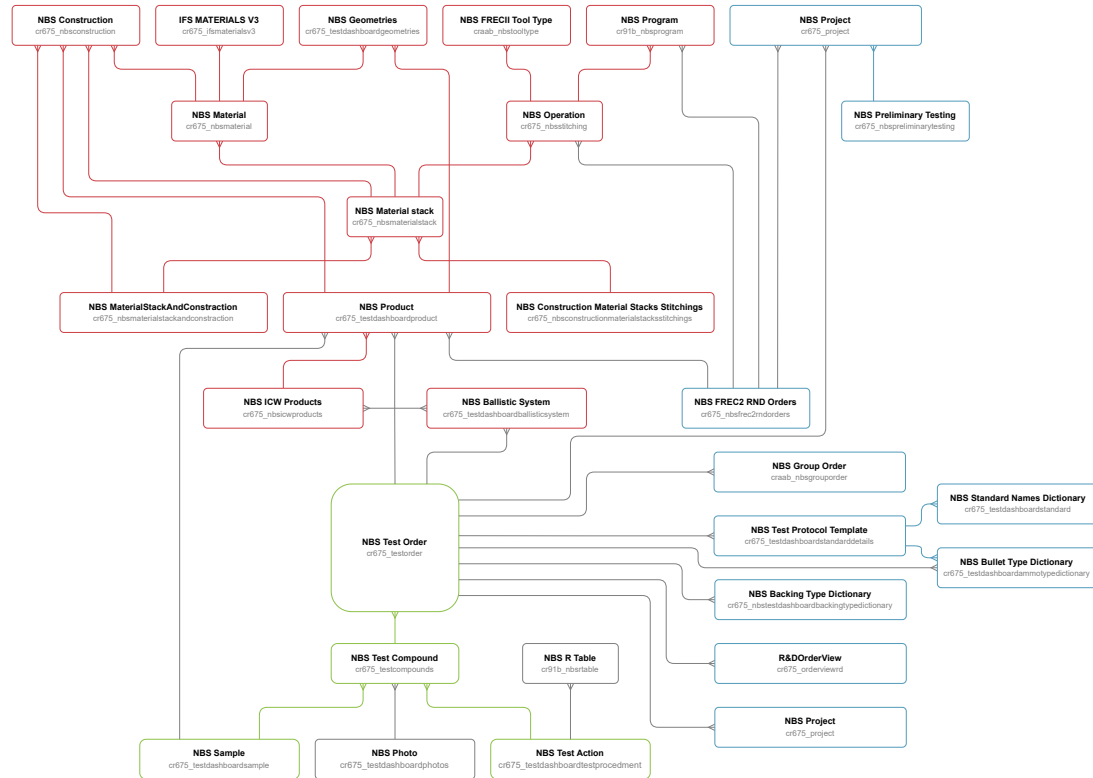

2.2.1 List of Tables

This is a list of tables used by NBS. The end user will probably recognize the tables by their display name; however, when programmatically exploring the data, the logical name is used to identify tables.

Display Name	Logical Name
NBS Test Action	cr675_testdashboardtestprocedment
IFS MATERIALS V3	cr675_ifsmaterialsv3
NBS Construction Material Stacks Stitchings	cr675_nbsconstructionmaterialstacksstitchings
NBS IFS MATERIALS	cr675_nbsifsmaterials
NBS Material stack	cr675_nbsmaterialstack
NBS Sample	cr675_testdashboardsample
NBS Test Compound	cr675_testcompounds
NBS Test Order	cr675_testorder
NBS ICW Products	cr675_nbsicwproducts
NBS R Table	cr91b_nbsrtable
NBS Ballistic System	cr675_testdashboardballisticsystem

NBS Powder Type Dictionary	cr675_nbstestdashboardpowdertypedictionary
NBS Photo	cr675_testdashboardphotos

2.2.2 Entity Relationship Diagram

This is the Entity Relationship Diagram of the main tables used in NBS. It provides a clear picture of the relationships between tables and can serve as a suggestion for which tables should be merged while preparing data for analysis.

The diagram uses Barker's Notation for entity relationships. For reference see [Barker's ERD Notation](#)

Colors used in the diagram are used for logical grouping of tables:

- Tables related to **materials/constructions** are highlighted in **red**.
- Tables related to **tests** are highlighted in **green**.
- Tables which serve as **dictionaries/indexes** are highlighted in **blue** (these are the first ones to be merged when doing data preparation).
- Tables which are **useless/obsolete** are highlighted in **gray**.

2.2.3 Detailed Inventory of Tables

This section contains a detailed inventory of tables along with their row and column counts, relationships with other tables, and a list of their columns. To avoid cluttering the main document, I have chosen to show only columns with over 50% non-null values. The full inventory is available in the [Appendices](#) section in the form of a .json file, as well as a .pdf and its markdown .md source file.

2.3 Solutions

A **solution** is a logical container for components such as tables, apps, dashboards, and other resources that are related to a specific process or system. Solutions play a key role in organizing and managing system components, particularly when moving them between environments.

As described by Microsoft:

Solutions are used to transport apps and components from one environment to another or to apply a set of customizations to existing apps. A solution can contain one or more apps as well as other components such as site maps, tables, processes, web resources, choices, flows, and more.

[Source](#)

In the context of the NBS system, it was critical to identify which solutions were associated with the system. This information will be essential for migrating the NBS system from the current NFM Group Def environment to the NFM Group NBS DEV environment. Properly identifying and organizing these solutions ensures that all related components—tables, apps, and workflows—are migrated seamlessly.

Each solution has a **display name** (used for easy identification) and a **unique name**, which serves as an identifier for system-level operations. This distinction helps ensure that the correct solutions are managed during customization or migration efforts.

2.4 Reports

One of the tasks for this project was to review all of the Power BI Reports used in the NBS Workspace. Each report has been reviewed and described in detail.

Here is a comprehensive inventory of all the reports in the NBS Workspace. Each report contains a description, a list of pages available, filters available, graphs used in the report, and tables used by the report.

2.4.1 List of Reports Related to NBS

Report name	Semantic model used
Count of Tested Samples	Count of Tested Samples
Pressed plates count	Pressed plates count
NBS Report Test Range Monitor PL	NBS Report_Test Range Monitor
NBS Report_Test Range Monitor	NBS Report_Test Range Monitor
NBS Report	NBS Report
NBS BSR v1	NBS Report
NBS Report_Eabs analysis	NBS Report

2.4.2 Inventory of Reports Related to NBS

This section includes a detailed inventory of all reports related to NBS, including descriptions, pages, filters, and data sources for each report.

Report: Count of Tested Samples

This report provides an overview of ballistic tests amount categorized by client and project, using metrics like PBFS and V50. The report includes filters for date, project, and client. The report contains two pages: HB for hard ballistics and SB for soft ballistics.

Configured by: Anders Wien

Semantic model used: Count of Tested Samples

Pages available:

- HB
- SB

Filters available:

- Date
- Project
- Client

Graphs / Plots used:

- **Graph name:** Hard Ballistic Tested Count

Shows the total count of ballistic tests performed on hard ballistics divided to V50 and PBFS, categorized by client and project.

- **Graph name:** Soft Ballistic Tested Count

Shows the total count of ballistic tests performed on soft ballistics divided to V50 and PBFS, categorized by client and project.

Report: Pressed plates count

This report provides a detailed overview of pressed ceramic prototypes, categorized by project and product. It includes key metrics such as the count of raw material lists, vacuum bags, and total counts for each product under various projects. Users can filter the data by ordered and delivered dates, project, owner, and invoicing status. The report also includes a page for non-ceramic prototypes.

Configured by: Anders Wien

Semantic model used: Pressed plates count

Pages available:

- Ceramic
- Non-Ceramic

Filters available:

- Ordered Date
- Delivered Date
- Project
- Owner
- Invoicing Status

Graphs / Plots used:

- **Graph name:** Count of pressed prototypes | Ceramic

Shows the total number of pressed plates, categorized by project and product alongside raw materials list and pressing type.
- **Graph name:** Count of pressed prototypes | Non-ceramic

Shows the total number of pressed plates, categorized by project divided by pressing types such as helmet mould, uniaxial plate mould or vacuum bag.

Report: NBS Report_Test Range Monitor

This report provides a comprehensive view of test range activities. It visualizes key metrics such as incoming orders, backlog, samples tested, and threats tested over time. The report includes various sections: Year to Date Overview displays incoming orders and samples categorized by their status (such as cancelled, received, or shipped) and visualizes the backlog and the oldest open orders. The Samples Tested section is a visual representation of the number of samples tested, categorized by client and project. The Threats Tested section provides a visual representation of the number of threats tested, broken down by threat type. The Last 2 Weeks Overview focuses on recent test activities, including the number of samples and threats tested. BFS Depth and Stanag V50 Measurements sections display graphs showing BFS depth measurements and V50 measurements for different ballistic systems and constructions. The Construction List section contains a detailed list of ballistic systems, constructions, and material stacks with associated weights and thicknesses. Finally, the Test Log provides a comprehensive log of individual test samples, including details such as timestamp, project name, ballistic system, BFS depth, projectile used, and other test parameters. The report is fully interactive.

Configured by: Anders Wien

Semantic model used: NBS Report_Test Range Monitor

Graphs / Plots used:

- **Graph name:** Year to Date Overview
 - | Visualizes incoming orders and samples by their status, along with backlog and oldest open orders.
- **Graph name:** Samples Tested
 - | Displays the number of samples tested, categorized by client and project.
- **Graph name:** Threats Tested
 - | Provides a visual representation of the number of threats tested, broken down by threat type.
- **Graph name:** BFS Depth Measurements
 - | Shows BFS depth measurements for different ballistic systems.
- **Graph name:** Stanag V50 Measurements
 - | Displays V50 measurements for various constructions.
- **Graph name:** Construction list
 - | A detailed list of ballistic systems, their constructions, and material stacks with associated weights and thicknesses
- **Graph name:** Test log

Detailed test log, capturing test parameters such as timestamp, project name, ballistic system, shot number, stop indicators, BFS depth, projectile details, angle, velocity, and drop test results. It is designed to track test results.

Report: NBS Report

This report provides a comprehensive overview of ballistic tests, including detailed information about ballistic systems, construction, material stacks, and individual test results. It includes filters for project name, test date, test institute, and ballistic system. The report is divided into several sections including: 1) A detailed breakdown of ballistic systems and their associated construction and material stacks, 2) A table of test results showing parameters like projectile type, angle, conditioning temperature, BFS depth, and V50 values, 3) Graphical representation of PBFS distribution by ballistic system with drill-down capabilities, 4) A history of Stanag V50 values, and 5) A log regression graph of speed versus probability.

Configured by: Anders Wien

Semantic model used: NBS Report

Pages available:

- Ballistic Systems Overview
- Test Results
- PBFS Distribution
- Stanag V50 History
- Log Regression

Filters available:

- Project Name
- Ballistic System
- Test Date
- Test Institute

Graphs / Plots used:

- **Graph name:** Test results

Detailed test log, capturing test parameters such as sample ID, serial number, shot number, if valid indicator, projectile details, angle, velocity, stop indicator, BFS depth, BFS diameter, test condition, clay temperature, drop test results, room temperature, humidity, projectile weight, type of cartridge, muzzle distance, powder type, powder weight, project name, ballistic system and timestamp.

- **Graph name:** PBFS Distribution

Displays PBFS distribution by ballistic system with drill-down capabilities.

- **Graph name:** Stanag V50 History
| Shows the history of Stanag V50 values.
- **Graph name:** Log Regression
| Graph of speed versus probability of V50.

Report: NBS BSR v1

This report provides comprehensive insights into the ballistic systems, materials, and test results. It includes sections for ballistic system overview, material stack details, test orders, and test samples. The report also features various charts such as PBFS distribution, Stanag V50 history, and density of PBFS. Additionally, there is a section for key influencers that analyzes the most important factors impacting V50 values.

Configured by: Bartłomiej Bielski
Semantic model used: NBS Report

- Pages available:**

 - Construction
 - Order Status
 - Projectile
 - Test Order ID
 - Project Name
 - Date Range
 - Valid
 - Shot Number
 - V50 Value Increase/Decrease

- Graphs / Plots used:**
- **Graph name:** Material stack
| Table of material stacks with their price, weight and thickness.

- **Graph name:** Test orders
Detailed table of test orders.
- **Graph name:** Test samples
Table of test samples with parameters like serial number, sample weight, sample thickness and depth of cut.
- **Graph name:** Test results
Detailed test results table.
- **Graph name:** PBFS Distribution
Shows PBFS distribution by ballistic system with drill-down capabilities.
- **Graph name:** Stanag V50 History
Displays the historical values of Stanag V50.
- **Graph name:** Density of PBFS
Visualizes the density distribution of PBFS across different samples.
- **Graph name:** PBFS in mm (count of panels)
Visualizes the count of panels per milimeter.
- **Graph name:** Key Influencers
Analyzes the factors most influential in changing V50 values.

Report: NBS Report_Eabs analysis

This report provides detailed analysis on the efficiency and performance of ballistic systems. It includes several visualizations such as cost efficiency vs thickness efficiency, Eabs(V50) vs thickness, and other relevant metrics like AD efficiency. It also features filtering options by projectile type to analyze the impact of different projectiles on the ballistic system performance.

Configured by: Anders Wien

Semantic model used: NBS Report

Filters available:

- Projectile Type

- Ballistic System

Graphs / Plots used:

- **Graph name:** Cost Efficiency vs Areal Density Efficiency
| Compares the cost efficiency with areal density efficiency across different ballistic systems.
- **Graph name:** Cost Efficiency vs Thickness Efficiency
| Compares the cost efficiency with thickness efficiency across different ballistic systems.
- **Graph name:** Eabs(V50) vs Thickness
| Plots Eabs(V50) against the thickness of the material for given projectile.
- **Graph name:** Eabs(V50) vs Material Cost
| Plots Eabs(V50) against the material cost of the material for given projectile.
- **Graph name:** Eabs(V50) vs Aerial Density
| Plots Eabs(V50) against the areal density of the material for given projectile.

Report: NBS Report_Eabs analysis_Terje_cleaned2

This report provides an in-depth analysis of ballistic systems by evaluating various metrics such as cost efficiency, thickness efficiency, and Eabs (V50) against factors like thickness, material cost, and AD efficiency. The report consists of multiple pages, each focusing on different aspects of ballistic performance. Key pages include 'E50 & V50 vs AD,' 'AD efficiency vs Ballistic system,' 'Cost efficiency vs Ballistic system,' 'BFS and bullet speed vs Material,' 'BFS and cost vs Material,' and 'BFS and Area density.' The visualizations allow for detailed comparisons across different ballistic systems, aiding in decision-making regarding materials and constructions.

Configured by: Grzegorz Huk

Semantic model used: NBS Report

Pages available:

- Page 1
- E50 & V50 vs AD
- AD Efficiency vs Ballistic System
- Cost Efficiency vs Ballistic System
- BFS and Bullet Speed vs Material

- BFS and Cost vs Material
- BFS and Area Density

Filters available:

- Projectile
- Ballistic System
- Bullet Weight
- Hit Angle
- Test Goal Type
- Conditioning Temperature
- Backing Type
- Depth of Cut

Graphs / Plots used:

- **Graph name:** Cost Efficiency vs AD2 Efficiency

Scatter plot showing the relationship between cost efficiency and AD2 efficiency for various ballistic systems, with a trend line indicating correlation.

- **Graph name:** Cost Efficiency vs Thickness Efficiency

Scatter plot showing the relationship between cost efficiency and thickness efficiency for various ballistic systems, with grid lines to indicate ranges.

- **Graph name:** Eabs(V50) vs Thickness

Scatter plot illustrating the relationship between absorbed energy at V50 and thickness for various ballistic systems, with a trend line showing correlation.

- **Graph name:** Eabs(V50) vs Material Cost

Scatter plot showing the relationship between absorbed energy at V50 and material cost for different ballistic systems using the PS Ball projectile, with a trend line.

- **Graph name:** Eabs(V50) vs Area Density (AD)

Scatter plot illustrating the relationship between absorbed energy at V50 and Area Density (AD) for various ballistic systems, with a trend line indicating correlation.

- **Graph name:** Area Density vs E50

Scatter plot showing the relationship between Area Density and E50 for various ballistic systems, with a trend line to show the correlation.

- **Graph name:** AD2 Efficiency by Ballistic System and Name

Bar chart displaying AD2 efficiency for various ballistic systems, color-coded by projectile name, showing performance in energy absorption.

- **Graph name:** Cost Efficiency vs V50 by Ballistic System

Bar chart showing cost efficiency of various ballistic systems with a line plot overlay for V50 value, allowing comparison of cost efficiency and ballistic performance.

- **Graph name:** BFS and Projectile Velocity for 7.62 Projectile

Graph visualizing Backface Signature (BFS) and projectile velocity for various ballistic systems using a 7.62 caliber projectile, comparing BFS depth and speed.

- **Graph name:** Area Weight vs. BFS for Various Ballistic Systems

Scatter plot showing the relationship between area weight and average BFS depth for different ballistic systems, with a trend line indicating the correlation.

- **Graph name:** Min BFS, Max BFS, and Bullet Speed by Ballistic System

Graph showing minimum and maximum BFS in millimeters and bullet speed for various ballistic systems, comparing BFS and bullet speed performance.

• **Graph name:** Min BFS, Max BFS, and Area Density by Ballistic System

Graph showing minimum and maximum BFS and area density for various ballistic systems, analyzing the relationship between BFS and area density.

3 Data Quality Analysis

As part of the NBS system exploration, a comprehensive analysis of the data stored in the system was conducted. This section highlights the major data quality issues identified during the analysis, including data incompleteness, inconsistencies, and duplicates. These issues present significant challenges to the system's reliability and make data analysis difficult and time-consuming.

3.1 Data Collection and Methodology

The data has been collected using the Dataverse Web API as well as the Power BI Web API. I have created a Python script, `api_connect.py`, which consists of a `DataverseConnector` class as well as a `connect_to_powerbi` function. The script handles the connection to APIs and user authentication. For more details on this script, refer to the [Appendices](#). The code is well documented and commented.

The data for each table has been saved to `.csv` files, which are available in the [Appendices](#). These files serve as the primary dataset for the analysis conducted in this document.

...

3.2 Data Quality Issues

The overall data quality of the whole dataset is very poor. The data cleaning and preparation processes for any analysis are tedious and time-consuming due to a number of issues. This section gives an overview of common issues found while exploring and analyzing the NBS data.

3.2.1 Nondescriptive Logical Column Names

Many columns have unclear or incorrect logical names, making it difficult to understand their purpose. A common issue is the use of column names ending in `...id` that store names, not unique IDs as expected.

Example

The `cr675_testorder` table has a column `cr91b_depthofpenetrationinmm`, which stores boolean values (`True/False`) instead of numeric data. Upon investigation, this column was found to indicate whether the test order was for hard or soft ballistics. A more appropriate name would be `cr91b_ishardballistics`.

3.2.2 Inconsistent Column Formats

Most categorical columns suffer from inconsistent formats, making analysis difficult or impossible.

Example

The `cr675_testdashboardammotypedictionary` table contains a `cr675_bulletcaliber` column, which is of string type. Example values include:

BulletCaliber
9 x 19 mm
5.56
2,642mm
7,62
7,62x39 AK47
308 Win.
.40 / 10 mm
.357 in

This data is not useful for analysis without extensive cleaning and standardization. Different formats, additional information stored alongside the caliber (e.g., AK47), ambiguities in values and units make it very hard to analyze.

For data to be useful and ready for analysis, it needs to be standardized and consistent. The `cr675_bulletcaliber` should store a caliber value in one unit of choice (e.g., millimeters or inches) with consistent formatting. Using the above example, the proper data should look like this:

BulletCaliber
9.00
5.56
2.64
7.62
7.62
7.82
10.00
9.00

3.2.3 Wrong Column Types

Many columns are stored as strings when they should contain uniform numeric values, further complicating analysis.

3.2.4 Duplicate Information

Several columns contain redundant information. In some cases, multiple columns needed to be merged to obtain meaningful data during the exploration process.

Example

Using the same table as above, it contains columns `cr675_produceraccount`, `cr675_name`, and `cr675_bulletnamewithproducername`. The last one is just a join of the two previous columns and is redundant. Moreover, most of the `cr675_produceraccount` column is empty, so `cr675_bulletnamewithproducername` contains just a duplicate of `cr675_name` with a colon appended.

3.2.5 High Percentage of Empty Columns

A significant portion of the columns are largely empty, with minimal data recorded. This indicates a lack of enforcement of data entry standards and contributes to the overall data incompleteness.

Example

In the `cr675_testdashboardprocedement` etable, 13 custom columns have less than 50% data completeness, with six of these columns entirely empty.

3.2.6 Lack of Required Fields

Few columns are marked as "required," resulting in significant data gaps. This exacerbates the incompleteness of the dataset and reduces its overall reliability.

3.2.7 Redundant Tables and Columns

Some tables and columns appear to be redundant, either due to duplication or subsetting of data from other tables. This redundancy adds unnecessary complexity to the data model.

3.3 Summary

The data is mostly unusable, even for data cleaning. The lack of enforcement of data input results in incomplete datasets. The lack of standardization of formatting and column types leads to data being mostly stored in text, often with comments and additional redundant information, which is not ideal for analysis.

It seems that these tables are being used by the engineers like Excel spreadsheets when they should be treated as datasets. It is mostly useless to collect data in this manner because it cannot be analyzed easily, or the cleaning process requires verifying every row and cross-referencing documentation or consulting an expert on domain knowledge.

4 Code Documentation

4.1 Scripts Overview

During the project I wrote a collection of Python scripts which I used to automate data collection, processing, working with data as well as even generate parts of documentation. I categorized them into two groups: **Data Collection and Processing** as well as **Markdown Generation**.

4.2 Data Collection and Processing Scripts

4.2.1 `api_connect.py`

This Python script provides functionalities to connect and retrieve data from Microsoft Dataverse and Power BI using the OData API and MSAL (Microsoft Authentication Library). It offers tools to interact with both services, manage authentication, and handle data requests.

Main components

1. `DataverseConnector` class manages connection and data retrieval from Microsoft Dataverse using OData Web API
2. `connect_to_powerbi` function handles connections to Power BI API for retrieving data

Dependencies

Before trying to use the script, ensure that the following Python packages are installed by running

```
pip install msal requests pandas
```

Usage Example

For Dataverse

```
connector = DataverseConnector("path/to/auth_details.json")
data = connector.obtainJson("accounts")
print(data)
```

For Power BI

```
cdata = connect_to_powerbi("groups", "path/to/auth_details.json")
print(data)
```

4.2.2 `download_data.py`

This script is designed to fetch data from Microsoft Dataverse, process it, and save it in CSV format. It uses the `DataverseConnector` class from `api_connect.py` to authenticate and retrieve data from the Dataverse Web API.

Usage Example

To execute the script, run it as is, or modify the `entities_to_process` and `output_directory` variables.

4.2.3 `table_inventarization.py`

This script performs a comprehensive inventory of given tables within Microsoft Dataverse. It retrieves metadata, attributes, and relationships for a set of specified tables and outputs this information into a JSON file. The resulting inventory can be used for further analysis or reporting on the structure and contents of the tables.

Usage Example

This script is designed to run as is, but if you need to modify the list of tables to process or change the output directory, you can update the `entities_to_process` list or the path where the JSON is saved.

4.2.4 `solution_inventarization.py`

This script is responsible for gathering and inventorying metadata about solutions and their components. The data is retrieved, processed, and saved as a JSON file. This provides insight into various components related to a solution such as entities, apps, web resources, and more.

Usage Example

To run the script, simply execute it as is, however if you need to modify the list of solutions to process or change the output directory, you can update the `solutions_to_process` list or the path where the JSON is saved.

4.3 Markdown Generation Scripts

These are the helper scripts I used to generate parts of this documentation from json inventories. They are not crucial to understand but I documented them either way.

Each script follows a similar pattern

1. Read JSON data
2. Generate raw Markdown
3. Save Markdown as .md file

4.4 Note

Each of these scripts are documented in the form of Python Docstrings as well as comments within their respective files.

5 Recommendations

5.1 Continue Data Profiling

Data profiling should be an ongoing process to identify and address issues across all tables. Each table should be inspected individually, and issues should be noted. For example, the `tables_inventory.json` file can be extended with detailed issue summaries for each table. Example:

```
[
  {
    "display-name": "NBS_Test_Order",
    "logical-name": "cr675_testorder",
    "set-name": "cr675_testorders",
    "primary-id": "cr675_testorderid",
    "primary-name": "cr675_orderid",
    "attribute-count": 90,
    "custom-attribute-count": 72,
    "row-count": 3394,
    "issues-summary": [
      "Issue_1",
      "Issue_2",
      "Issue_3"
      // More issues...
    ],
    "attributes": [
      {
        "display-name": "Client",
        "logical-name": "cr675_client",
        "description": "cr675_testorder_._cr675_client",
        "data-type": "Lookup",
        "is-custom": true,
        "statistics": {
          "non-null-count": 3394,
          "unique-values-count": 9,
          "top-5-most-frequent-values": {
            "NFM_P_CC205_RDB_Ballistic": 1161,
            "NFM_P_CC107_QC": 1143,
            "NFM_P_CC208_RDB_Strategic": 844,
            "NFM_P_CC210_HJELM": 147,
            "NFM_US_LLC": 60
          }
        }
      },
      {
        "issues": [
          "Issue_1",
          "Issue_2",
          "Issue_3"
          // More issues...
        ]
      }
    ]
  }
  // More columns...
],
```

```

    "relationships": [
      {
        "related-table": "systemuser",
        "relationship_type": "many-to-one",
        "is-custom-relationship": false,
        "local-attribute": "createdby",
        "foreign-attribute": "systemuserid"
      }
      // More relationships...
    ]
  }
  // More tables...
]

```

5.2 Migrate NBS System from Default Environment

The NBS system should be migrated from the NFM Group Def environment to the dedicated NFM Group NBS DEV environment. This migration will improve data management, security, and scalability, ensuring a more stable and efficient system.

5.3 Refactor and Standardize Data

Tables and columns with incorrect data types should be refactored. Standardization efforts should focus on ensuring that columns are stored in the correct formats to make data analysis easier and more reliable.

5.4 Consolidate Redundant Tables and Columns

Redundant tables and columns should be merged or removed to simplify the data model. Consolidating overlapping tables will reduce complexity and improve overall system performance.

5.5 Implement Required Fields and Validation

Critical columns should be marked as "required" to improve data completeness. Additionally, validation rules should be implemented to ensure consistent data entry, particularly for numeric values, dates, and key identifiers.

5.6 Remove Unused Input Fields

Input fields which are not in use should be removed as they don't contribute to the system. It is recommended to conduct an audit of all current input fields to identify which ones are not in use, and to then remove them. This will not only clean up the user interface but also improve overall system performance by reducing redundant metadata in the database.

5.7 Clean Mostly Filled Dictionaries

Many dictionaries in the system, such as the ones used for threats, clients or ammunition, are mostly filled, but they suffer from inconsistent or incomplete data entries. These dictionaries should be reviewed and cleaned. Once cleaned, implement restrictions on who can add new entries to these dictionaries. Additionally, implementing strict data validation rules during entry is recommended.

5.8 Use External Registers Where Possible

Where applicable, external registers or reference data should be used to avoid data redundancy. For example, the project list or other table registers that are externally maintained can be linked directly to NBS. This will improve the data's reliability and consistency.

6 Appendices

The appendices provide supplementary materials and references that were used throughout this documentation. These resources are essential for anyone wishing to validate the findings or extend the analysis.

6.1 Appendix 1: Data Files

The raw data exported from the NBS system is available in .csv format in the data folder. These files contain all relevant columns formatted for human readability.

6.2 Appendix 2: Inventories

The `inventories` folder contains `.json` files that provide a comprehensive listing of the tables, solutions, and Power BI reports used in the NBS system. These inventories serve as an index for anyone working with the system's data.

6.3 Appendix 3: Markdown Files

The following `.md` files available in the `markdown` folder contain the inventories from Appendix 2, programmatically transformed into human-readable markdown files, which can be easily exported to PDF.

6.4 Appendix 4: Python Scripts

The Python scripts used for API connection and data collection are provided in the `scripts` folder. These scripts facilitate data retrieval, inventory generation, and markdown conversion.

6.5 Appendix 5: Entity Relationship Diagram

A simplified Entity Relationship Diagram (ERD) is available in the `diagram` folder. This diagram shows the key relationships between tables in the system, providing a visual aid for understanding the data structure. It's available in `.png`, `.svg` and `.pdf` formats as well as the original editable `.drawio` file.

6.6 Appendix 6: Glossary of Terms

Term	Definition
Ballistic System	A product or set of products designed for ballistic testing.
Construction	A combination of multiple material stacks in a specific order, often involving different stitching techniques.
Material	The basic ingredient of every ballistic construction.
Material Stack	A group of one or more layers of the same material stacked together to form part of a construction.
Operation	The type of stitching used to bind materials within a material stack or to join different stacks in a construction.
Test Order	A formal request for performing ballistic tests on a specific product or system according to predefined standards and protocols.
V50	A ballistic testing parameter that measures the velocity at which there is a 50% probability that a projectile will penetrate a material.
BFS (Backface Signature)	The depth of deformation caused on the back face of a material when it is struck by a projectile.
PBFS	Perforation-Backface Signature. Interchangeable with BFS
Areal Density (AD)	A measure of the weight of a ballistic material or construction per unit area, typically expressed in kg/m ² .
Power BI	A Microsoft analytics service used to visualize and analyze the data collected from ballistic tests and create reports and dashboards.
Dataverse	A cloud-based data platform used to store and manage data for applications such as the NBS system.
API	Application Programming Interface, used for interacting with Dataverse and Power BI to retrieve data for analysis.
Entity	A table or database object used in Microsoft Dataverse that stores structured data (e.g., NBS Test Order, NBS Material Stack).

Attribute	A column in an entity that stores specific information about that entity (e.g., Test Date, Projectile Type).
Test Protocol	A set of predefined steps and conditions under which ballistic tests are conducted.
Uniqueidentifier	A data type used to represent a unique value for identifying tables (e.g., UUID).
Lookup Field	A reference field that allows linking one table to another within Dataverse, helping establish relationships between data.
Primary Key	A unique identifier for each record in a database table, ensuring that each record can be uniquely identified.
Foreign Key	A field that links one table to another, establishing a relationship between the data stored in both tables.
Data Completeness	A measure of how much of the expected data is available in each column, often expressed as a percentage.
Data Profiling	The process of reviewing and analyzing data to assess its quality, including checking for missing, duplicate, or inconsistent data.
Data Inconsistency	Occurs when data does not follow a consistent format or structure, making it difficult to analyze or compare (e.g., different date formats in the same field).
Data Redundancy	The occurrence of duplicate or unnecessary data, which can complicate data storage and analysis.
Data Validation	The process of ensuring that data entered into a system meets predefined criteria for accuracy and consistency.
Entity Relationship Diagram (ERD)	A visual representation of how entities in a system relate to one another, used to understand data structure.
CSV (Comma-Separated Values)	A file format used for saving tabular data where each field is separated by a comma.
Required Field	A column that must contain a value in order for a record to be valid, ensuring that important data is always captured.
Data Incompleteness	When required or important fields in a dataset are missing values, affecting the reliability of the data.
